

REDACTED VERSION

FEB 15 2012

(b) (6)

Dear Ms. (b) (6)

The purpose of this letter is to inform you about the results of the soil samples that were collected from your property in August of 2011. These soil samples were within the 100-year floodplain of the San Jacinto River from four locations on your property within the top six inches of soil. These samples were combined for dioxin analysis to determine the average concentration. The sample results for your property are: 2.15 TEQ ng/kg, or parts per trillion, of dioxin. By way of comparison, the Environmental Protection Agency considers a dioxin level of 50 TEQ ng/kg to be protective of human health for residential exposure. The measured levels in your yard were significantly less than that.

Please call me at (214) 665-8318 if you have any questions on this.

Regards,

Gary Miller  
Remedial Project Manager
